

Keep What Works. Modernize What Doesn't.

- Reuse compatible existing phones instead of automatically replacing every device.
- Connect existing analog phones to cloud service through an ATA bank, allowing organizations to modernize without replacing phones or installing new Ethernet cabling.
- Avoid unnecessary rewiring in buildings that were not previously designed for IP phones.
- Maintain a familiar experience for residents and users who may be more comfortable with their existing phones.
- Move away from aging PBX infrastructure while minimizing disruption and upfront hardware costs.

Modernize Communications Without Starting Over

A Flexible Approach to Cloud Communications for Community and Multi-Site Organizations

Moving to cloud communications shouldn't mean replacing every phone, rewiring every room or paying for features every user doesn't need. So how do you modernize a legacy phone system without forcing a costly rip-and-replace?

Cloudli Connect gives organizations a flexible way to modernize their communications while working with their existing environment. By combining full-featured users, cost-effective extensions and compatible existing hardware, organizations can build a cloud communications solution around what they actually need.

v20260827-US-CA

One Platform. Different Environments.

Assisted Living and Retirement Communities

Modernize decades-old PBX infrastructure, including areas without existing Ethernet cabling, while allowing residents to continue using familiar phones. Cloudli works with partners to understand the existing infrastructure and determine where full-featured users, extensions, ATAs and/or new IP phones make the most sense.

Churches and Community Organizations

Move from legacy or higher-cost VoIP systems to cloud communications without overprovisioning. Mix full-featured users and extensions across offices, common areas and other locations to build around both operational requirements and budget.

Schools and Daycares

Provide classrooms and administrative areas with the functionality they need without purchasing a full user license for every room. Cloudli Extensions include the core calling features needed for minimum usage.

Municipalities & Multi-Site Organizations

Build a deployment around different requirements across offices, facilities and locations while maintaining one cloud communications platform.

Pay for What Each User Actually Needs

Not every room or common area needs its own fully licensed user.

With Cloudli Connect, organizations can mix and match user licenses based on how phones are actually used. So you can add full-featured users where you need them with cost-effective extensions where you don't.

This flexible model can significantly reduce the cost of bringing larger, multi-room environments to the cloud while still providing the functionality each location needs.
